Q2 Hospital Patient Registration – User-Defined Exception

10 marks

Develop a Java program for a hospital patient registration system. The program accepts the patient's name, age, and body temperature.

Create suitable user-defined exception classes for invalid age and invalid temperature.

Validate the input before registration. Use try-catch-finally and display a registration completion message from finally.

Sample Test Cases:

Input / Scenario Expected Result Purpose

Arun, 35, 98.6 Patient registered successfully Normal case

Meena, 12, 98.4 InvalidAgeException Boundary / exception case

Ravi, 45, 105.2 InvalidTemperatureException Invalid input

Kumar, -2, 98.1 InvalidAgeException Invalid input

Your Code

```

1 import java.util.*;
2 public class Main{
3     public static void main(String[] args){
4         Scanner sc=new Scanner(System.in);
5         try{
6             String name=sc.next();
7             int age=sc.nextInt();
8             double temperature=sc.nextDouble();
9             if(age<18|| age >100){
10                 throw new InvalidAgeException("Invalid age.");
11             }
12             if(temperature<95.0|| temperature>104.0){
13                 throw new InvalidTemperatureException("Invalid temperat

```

```
14         }
15         System.out.println("patient registered successfully");
16     }
17     catch(InvalidAgeException e){
18         System.out.println("InvalidAgeException");
19     }
20     catch(InvalidTemperatureException e){
21         System.out.println("InvalidTemperatureException");
22     }
23     finally{
24         System.out.println("Registration completed.");
25     }
26 }
27 }
28 class InvalidAgeException extends Exception{
29     InvalidAgeException(String message){
30         super(message);
31     }
32 }
33 class InvalidTemperatureException extends Exception{
34     InvalidTemperatureException(String message){
35         super(message);
36     }
37 }
```

Input

kumar -2 98.1

Output

```
InvalidAgeException  
Registration completed.
```
