Join

JOIN

Write a Java program to demonstrate how to use the "join" method to wait for a thread to complete its execution before proceeding with the main thread.

PROGRAM EDITOR

Java

Run

Save

```
1 public class Main {
2
3     // Static nested class extending Thread
4     static class WorkerThread extends Thread {
5         private final int id;
6
7         WorkerThread(int id) {
8             this.id = id;
9         }
10
11         @Override
12         public void run() {
13             System.out.println("Worker " + id + " started.");
14             try {
15                 // Simulate some work
16                 Thread.sleep(2000);
17             } catch (InterruptedException e) {
18                 System.out.println("Worker " + id + " interrupted.");
19             }
20             System.out.println("Worker " + id + " finished.");
21 }
```

OUTPUT

```
Main thread started.  
Main thread waiting for Worker to finish using join()...  
Worker 1 started.  
Worker 1 finished.  
Main thread resumes after Worker completed (join worked).
```
