Overriding

OVERRIDING

Write a Java program to demonstrate method overriding with a simple calculator. Create a parent class called Calculator with methods such as add(), subtract(), multiply(), and divide(). Then, create a child class called ScientificCalculator that overrides the multiply() method to perform a more complex calculation.

PROGRAM EDITOR

Java

Run

Save

```
1 public class Main {  
2  
3     static class Calculator {  
4         double add(double a, double b) {  
5             return a + b;  
6         }  
7  
8         double subtract(double a, double b) {  
9             return a - b;  
10        }  
11  
12        double multiply(double a, double b) {  
13            return a * b;  
14        }  
15  
16        double divide(double a, double b) {  
17            if (b == 0) {  
18                System.out.println("Error: Division by zero");  
19                return 0;  
20            }  
21
```

OUTPUT

---- Using Calculator ----

Add: 8.0

Subtract: 2.0

Multiply: 15.0

Divide: 1.6666666666666667

---- Using ScientificCalculator ----

Add: 8.0

Subtract: 2.0

ScientificCalculator: Squaring the product for advanced calculation
