Overloading

OVERLOADING

Write a Java program to demonstrate method overloading with variable arguments. Create a method called sum() that takes in a variable number of integers and returns their sum. Then, create an overloaded version of the sum() method that takes in a variable number of doubles and returns their sum.

PROGRAM EDITOR

Java

Run

Save

```
1 public class Main {  
2  
3     // Static nested class to hold the logic as requested  
4     static class Calculator {  
5  
6         // Method to sum variable number of integers  
7         public int sum(int... numbers) {  
8             int total = 0;  
9             for (int num : numbers) {  
10                 total += num;  
11             }  
12             return total;  
13         }  
14  
15         // Overloaded method to sum variable number of doubles  
16         public double sum(double... numbers) {  
17             double total = 0.0;  
18             for (double num : numbers) {  
19                 total += num;  
20             }  
21             return total;
```

OUTPUT

```
Sum of integers: 100  
Sum of doubles: 101.2
```
